RECKLI Graffix Basic

Product 04190

Edition 01/23

Durability of RECKLI Graffix Basic

RECKLI Graffix Basic is a modern oleophobic concrete impregnation based on polymeric resins. The ingredients used are commonly estimated as effective and durable oleophobic agents for concrete.

It effects:

- a significant reduction of water absorption
- a very low reduction of the water vapour permeability
- high surface penetration
- high UV-stability
- no gloss and no stickiness of the surface
- good resistance against alkali
- safe use
- environmental sustainability.

As indispensable precondition, the mineral substrate must be absorptive to water. The substrate must be free from repellent contamination (oil, grease, dust), damages (cracks) or other preceding treatments, which can affect the surface penetration.

According to our raw material suppliers' information we can warrant a 5 year durability of RECKLI Graffix Basic, if properly applied.

The beading effect is decreased by intensive traffic pollution. This doesn't affect the effectivity of the treatment, given a sufficient penetration depth.
